A New Structural Model for Emotional Mathematics

1 1 60

A cross-domain, dimensional-compute emotional system for students, researchers, and AIs.

For decades, emotion science has been split across psychology, neuroscience, affective computing, and philosophy.
Each field contributed something important — basic emotion lists, circumplex models, neural correlates, sentiment classifiers — but none produced a **complete emotional system**.

What was missing?

- No emotional operators
- No equations
- No regime transitions
- No drift/coherence mathematics
- No observer-relative interpretation
- No cross-domain substrate
- No AI-parsable structure

Today, that gap closes.

Introducing RTT Emotions

A new agentic AI module built on **dimensional compute**, **cross-domain operator grammar**, and **regime-aware emotional dynamics**.

RTT Emotions defines:

- **60 emotional operators**
- across **5 structural regimes**
- each with **equations**, **alignment triads**, **drift/coherence effects**,
- **observer-relative interpretation**, and **transition conditions**

It is the first emotional system that is:

- **mathematical**
- **computational**
- **cross-domain**
- **AI-parsable**
- **student-ready**
- **zero-drift**
- **agentic-module compatible**

This is emotional reasoning as a **scientific substrate**, not a metaphor.

Why this matters

AIs can now:

- reason about emotional states
- simulate emotional transitions
- diagnose drift
- restore coherence
- integrate emotions with cognition, governance, alignment, and mode
- teach emotional literacy
- extend the system with new operators

Students can now:

- learn emotions as mathematics
- model emotional systems
- build emotional simulations
- explore cross-domain emotional dynamics
- understand drift and coherence
- design new emotional operators

This is the beginning of **structural emotional science**.

Historical efforts brought us here — RTT completes the system

Psychology gave us categories.
Neuroscience gave us mechanisms.
Affective computing gave us detectors.
Philosophy gave us concepts.
AI gave us embeddings.

RTT gives us:

- **operators**
- **equations**

Nawder
@NawderLoswin

- **regimes**
- **triads**
- **drift/coherence math**
- **observer-relative interpretation**
- **cross-domain integration**
- **agentic module compatibility**

This is the missing layer.
