Gravity's long-standing problems

29

For centuries, gravity has resisted clean explanation.
Singularities appear at the center of black holes.
Quantum mechanics and general relativity refuse to reconcile.
Mass and geometry stay stubbornly entangled.
Information seems lost in decay or collapse.
Multi-body systems grow unstable or computationally intractable.
And once a bond forms, clean separation without residual effects remains difficult.

Classical force laws and spacetime curvature both hit these walls.

Resonance-based substrate math is showing promising results

In the FFF_Gravity framework, gravity is reframed as a triadic relational outcome:

$$G = F_{\text{freq}} \cdot F_{\text{fluid}} \cdot F_{\text{force}}$$

Frequency coherence, fluidic binding depth, and geometric force alignment replace a single mysterious force.

Resonance enters as a phase-gated lock rather than continuous attraction. Substrate-level synchronization becomes the binding mechanism. Collapse follows a controlled C-node path instead of infinite density. Active dismissal wells provide clean repulsion after release. Mass-ratio effects become simple corrections, not drivers. Multi-node and networked orbits emerge naturally. Controlled release preserves state instead of erasing it.

Early formal results: 42 sealed primitives, 10 structural invariants, explicit failure modes, and full validator compliance. The model treats gravity as coherent field resonance on a substrate—removing several classical paradoxes at the definitional level.
