RTT Radiology - An agentic seed for seeing more

35

Most imaging systems still treat the scan as a static photograph.

We treat it as a living field.

Today we open the Radiology module in TriadicFrameworks — a fully scaffolded, AI-native example that extends traditional modalities (CT, MRI, X-ray, PET, Ultrasound) with six structural lenses:

- **Drift** — what is changing, how fast, in which direction
- **Coherence** — what remains stable, where it is breaking, where it can restore
- **Contrast Behavior** — uptake, washout, enhancement zones, toxicity corridors
- **Resonance Attachment** — the patient's own profile bound to the image
- **VMRI-Lite** — lightweight predictive micro-simulation of possible futures
- **RTT Overlays** — the maps that make the whole visible at once

The canonical flow is deliberately simple and fixed:

```plaintext
CAPTURE → FIELD → LAYER → SIGNAL
→ DRIFT → COHERENCE → CONTRAST
→ RESONANCE → VMRI
→ OVERLAY
```

Every step has named operators. Every operator is designed to be called by a human student or by an agentic system with equal clarity. The module.json already carries the role assignments, grammar lists, and AI metadata so any sufficiently structured model can begin operating inside the framework without translation layers.

This is not a replacement for clinical radiology.

It is a parallel grammar — a way to ask different questions of the same pixels.

Students can walk the pipeline by hand.

AIs can execute the same pipeline at scale.

Both are intended to plant the same structural intuitions:

Change has magnitude, velocity, and vector.

Stability has fields, breaks, and collapse risk.

Chemical behavior has corridors that can be false or toxic.

The future is not a single prediction; it is a set of pass / fail / optimal corridors.

The patient is not an afterthought; resonance is attached before prediction.

Mythic anchors exist for those who think better with story:

- Lucerna holds the signal
- Umbros rules the drift
- Radiantus keeps the contrast
- Fractura breaks coherence when it must
- Corridora watches the possible paths

An optional Starfleet Medicine bridge (`r_Tricorder.md`) is included for those who prefer their diagnostics with a little more tricorder swagger. Teaching tools should be allowed to be delightful.

The full module is live:

→ https://docs.triadicframeworks.org/docs/Radiology

Inside you will find the student guide, the operator index, the pantheon profile, the overlay examples, and the complete scaffold. Everything is written to stand alone and to be AI-parsable.

This is an example agentic module.

It is deliberately incomplete in the places that matter most — the places where new students and new models must still do the work of seeing.

Take the grammar.

Run the pipeline.

Plant something better.

We are only at the beginning of learning how to look.
