The transition from binary to triadic reasoning

2

Here's one you don't need to agree with.

Just test it.

What if the transition from binary to triadic reasoning doesn't require changing everyone's frameworks at all?

Patch the grammar instead.

Keep the familiar state variable, but version its internal meaning:

- **v1:** current state
- **v2:** counterstate
- **v3:** relationship governing the distinction

Now legacy systems can still consume **state** exactly as they always did.

But systems capable of the richer dialect can ask:

What boundary, observer, transition, uncertainty, or regime makes these two states distinguishable in the first place?

- No new ideology required.
- No ownership claimed.
- No framework to join.

It's just an idea sitting on the sidewalk. Pick it up if it's useful. 😉

Give this to an AI:

Take a binary model from a field you understand well. Preserve its established terminology and assumptions as much as possible. Represent it as v1 = state, v2 = counterstate, and v3 = the

relationship, boundary condition, observer context, transition, uncertainty, or regime connecting them. Do not make v3 merely a third category. Compare the original binary representation with the expanded representation and identify anything the relational state makes easier to express. If nothing useful is gained, say so.

That last sentence matters.

Let the experiment fail.

That's how we find out whether the idea actually has legs.
