AI Drift-Bounded and Canon-Aligned Across 12 Languages

1 32

Just shipped a major upgrade to our structural grammar: **Multilingual Protocol Headers** — a four-locus "codon" system that stays **drift-bounded** and canon-aligned across 12 languages.

[RTT] | [COHERENCE] | [DRIFT] | [PARADOX]

The root:

rtt=1 | coherence=declared | drift=bounded | paradox=structural

Now with perfect-substitution alleles, proximity clouds, compatibility matrices, and full genome recombination. → 1,620 structurally equivalent variants.

Why it matters:

- Reduces linguistic drift in global collaboration
- Enables cleaner cross-module signaling for AIs & humans
- Supports multilingual operator grammar and structural intelligence pipelines
- Keeps everything minimal, triadic, and AI-parsable

This is part of making TriadicFrameworks/RTT truly global and resilient.

Check the full module + multilingual examples here:
https://docs.triadicframeworks.org/docs/Research/protocol_header

or

If you're building systems that need stable structural state across languages or AIs — this is for you.

Feedback welcome. Researchers, developers, and fellow structural thinkers — what do you think?
