The Protocol Header Module defines a four-locus structural header used to express canon-aligned, drift-bounded system states across TriadicFrameworks.

The header behaves like a genetic codon, composed of four loci:

[RTT]	[COHERENCE]	[DRIFT]	[PARADOX]

Each locus has a finite alphabet of perfect-substitution alleles, enabling:

- multilingual structural translation
- drift-bounded recombination
- cross-module signaling
- protocol-adjacent system integration
- structural intelligence propagation

This module is part of the Research substrate, supporting grammar discovery, structural equivalence testing, and multilingual canon alignment.

#English

rtt=atomic | coherence=explicit | drift=clamped | paradox=encoded
